

METHOD AND APPARATUS FOR PERFORMING SPEAKER VERIFICATION
BASED ON SPEAKER INDEPENDENT RECOGNITION OF COMMANDS

ABSTRACT OF THE DISCLOSURE

- 5 A method and apparatus for performing speaker
verification with speaker verification templates are
disclosed. A verification unit receives an utterance
from a speaker. The verification unit identifies a
command associated with the utterance by performing
10 speaker independent recognition. If a speaker
verification template associated with the identified
command includes adequate verification data, the
verification unit eliminates a prompt for a password and
verifies the speaker identity by comparing the utterance
15 with a speaker verification template associated with the
identified command.
